

Runtime Analysis dashboard

Matthew Tonks

This would be to redesign a dashboard I created for our daily file load process

1st page (Landing Page)

Data Tool Dashboard

First row would be an aggregate of the weeks job runs by Source ERP each next to each other

Estel Eniteo D365 EDW Invex

EX:

Estel:

764 jobs

(5 runs errored (in red))

Then below it a plot of runtime per source ERP

last two weeks of runs

Below the plot of runtimes would be a DQ check

Check each ERP's data quality and show differences between expected vs actual:

Estel:

1012 tons difference

\$10,005 difference

Second Page Double Click Data Quality section:

Compare the differences by company source system for each Domain Sales, Receipts, Inventory, Purchase Orders, Sales Orders, etc

- Only show companies with differences to reduce clutter

Look at missing Dimension data (List all differences by Domain)

- Only show companies with differences to reduce clutter

Branches Products Vendors Customers

Runtime Analytics

Show a graph of runtime for Expected runtime Vs actual.

Have a list of jobs showing the jobs that are outside the expected range for that job

Track outliers for the data loads (more than expected data loads)

Track any issues with missing files from upload and overwritten files from that process
